

EMACSYS VD1 DISPLAY MODULE

User Manual

Introduction

The VD1 Display Module is designed to work with the EMACSYS Control Module and consists of 8 independent LEDs.

Power Requirements

The VD1 Display Module takes its power from the EMACSYS Control Module and as such no external power is required.

Current consumption is approximately 10mA for each illuminated LED.

Connecting Peripherals

The VD1 Display Module is provided with a connection lead and this should be connected to one of the output ports on the EMACSYS Control Module. Check carefully that the correct port is selected before powering the Control Module.

NOTE: Peripherals should not be connected with the power applied as this may cause damage to either the peripheral or the Control Module itself.
